

Aspect Oriented Programming (AOP)

Exercise AOP.1 – Basic Spring AOP

The Setup:

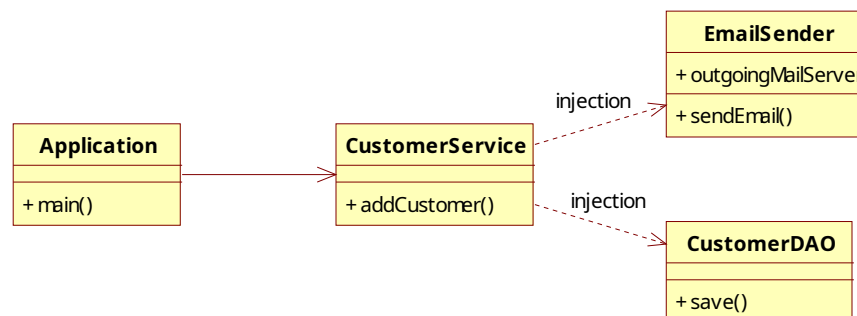

This exercise is a basic exercise to start using the Aspect Oriented Programming techniques available through the Spring Framework.

Start by downloading **W1D3-AOP-1** and add the **Spring dependencies** to it. Then also add the following AspectJ dependencies:

```
<dependency>
  <groupId>org.aspectj</groupId>
  <artifactId>aspectjrt</artifactId>
  <version>1.9.22</version>
</dependency>
<dependency>
  <groupId>org.aspectj</groupId>
  <artifactId>aspectjweaver</artifactId>
  <version>1.9.22</version>
</dependency>
```

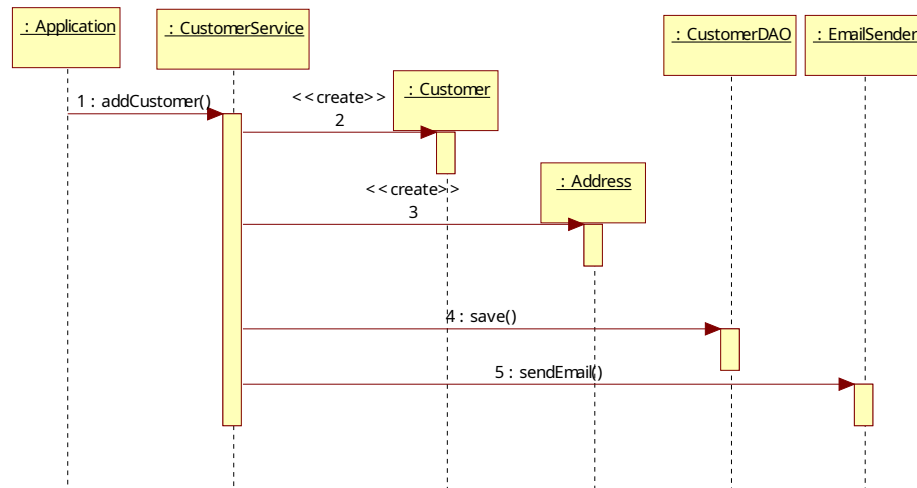

Be aware that if you use XML configuration your **springconfig.xml** file will require the **aop namespace** for this exercise.

The Application:

The provided application has a CustomerService class with an injected reference to the EmailSender class and an injected reference to the CustomerDAO class.

When addCustomer() is called on the CustomerService class it creates a Customer object and a corresponding Address object. The Customer is then saved to the database by the CustomerService by calling the save() method on the CustomerDAO, and an email is sent to the customer by calling the sendEmail() method on the EmailSender (see the sequence diagram on the next page)

Running the application should give the following output:

```
CustomerDAO: saving customer Frank Brown
EmailSender: sending 'Welcome Frank Brown as a new customer' to
fbrown@acme.com
```

The Exercise:

- Reconfigure the application so that whenever the `sendMail` method on the `EmailSender` is called, a log message is created (using an after advice AOP annotation).

Remember to configure Spring to look for your aspect annotations!

Running your updated code should produce the following output:

```
CustomerDAO: saving customer Frank Brown
EmailSender: sending 'Welcome Frank Brown as a new customer' to
fbrown@acme.com
Fri Jun 05 14:09:47 GMT 2009 method= sendMail
```

- Now change the log advice in such a way that the email address and the message are logged as well. You should be able to retrieve the email address and the message through the arguments of the **`sendEmail()`** method. This should produce the following output:

```
CustomerDAO: saving customer Frank Brown
EmailSender: sending 'Welcome Frank Brown as a new customer' to
fbrown@acme.com
Fri Jun 05 14:17:31 GMT 2009 method= sendEmail address=fbrown@acme.com
message= Welcome Frank Brown as a new customer
```

Please see the next page for part c) and d)

- c) Change the log advice again, this time so that the outgoing mail server is logged as well. The **outgoingMailServer** is an attribute of the **EmailSender** object, which you can retrieve through the **joinpoint.getTarget()** method. This should produce the following output:

```
CustomerDAO: saving customer Frank Brown
EmailSender: sending 'Welcome Frank Brown as a new customer' to
fbrown@acme.com
Fri Jun 05 14:22:24 GMT 2009 method= sendEmail address=fbrown@acme.com
message= Welcome Frank Brown as a new customer
outgoing mail server = smtp.acme.com
```

- d) Write a new advice that calculates the duration of the method calls to the DAO object and outputs the result to the console. Spring provides a stopwatch utility that can be used for this by using the following code:

```
import org.springframework.util.StopWatch;

public Object invoke(ProceedingJoinPoint call ) throws Throwable {
    StopWatch sw = new StopWatch();
    sw.start(call.getSignature().getName());
    Object retVal = call.proceed();
    sw.stop();

    long totaltime = sw.getLastTaskTimeMillis();
    // print the time to the console

    return retVal;
}
```

This should produce the following output:

```
CustomerDAO: saving customer Frank Brown
Time to execute save = 350 ms
EmailSender: sending 'Welcome Frank Brown as a new customer' to
fbrown@acme.com
Fri Jun 05 14:30:07 GMT 2009 method= sendEmail address=fbrown@acme.com
message= Welcome Frank Brown as a new customer
outgoing mail server = smtp.acme.com
```

How to submit:

Indicate how long it took you to do this exercise and what percentage you finished.

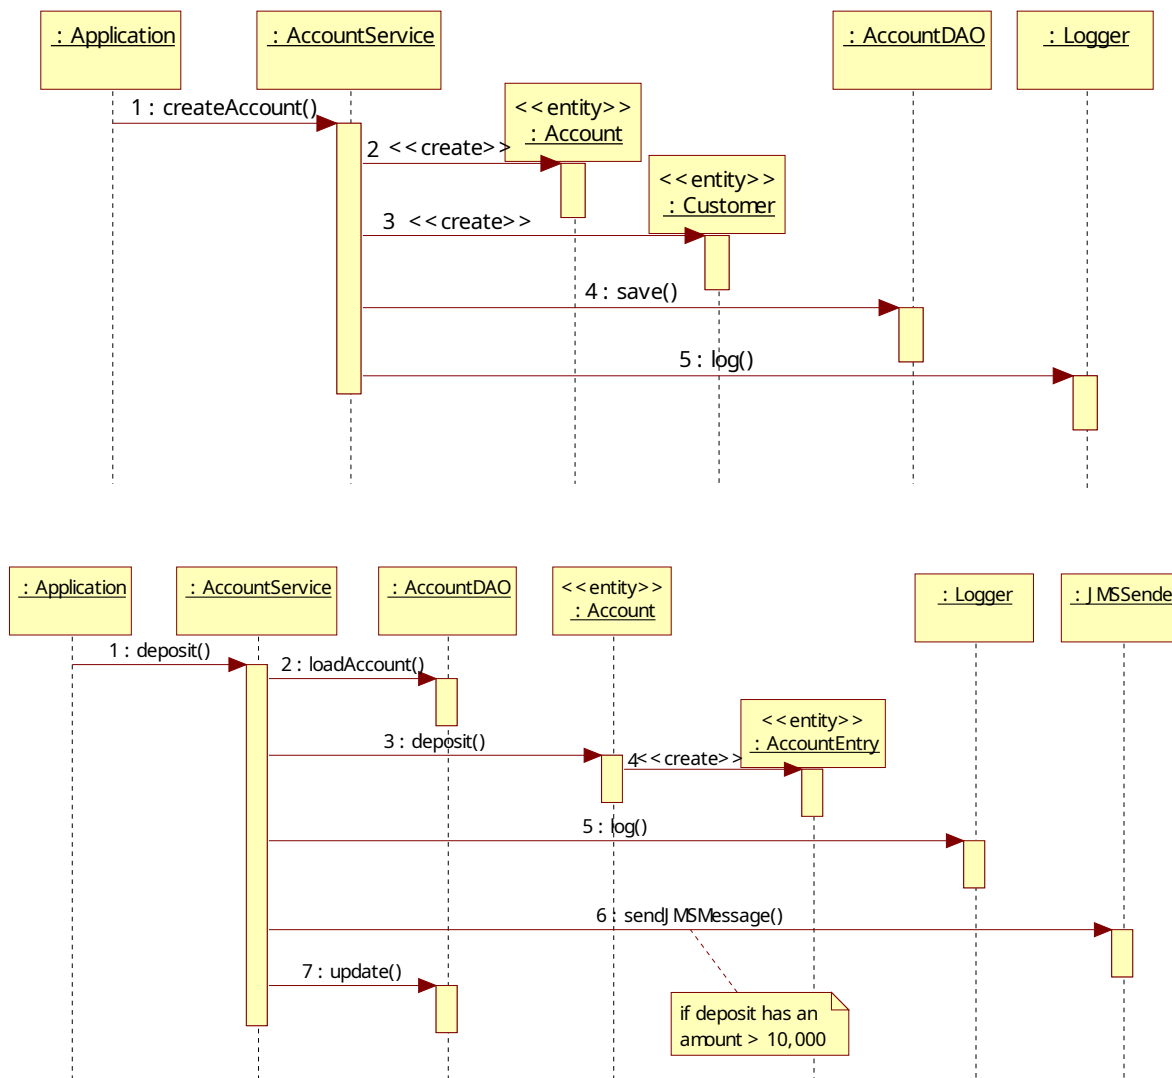

Be sure to delete the target directory from your project before creating the zip file that you upload for grading.

Exercise SSL.1 – Bank Application Dependency Injection

This exercise introduces the bank application. The bank application is a small application that embodies most of the architectural needs of a more real world enterprise application. Although the application that we start with in this exercise does not use any of Spring's features (yet), many areas in this application could benefit from them.

The Application:

The bank application uses an **AccountService** object to perform the various bank-related services such as creating accounts, depositing money (Euros or Dollars), withdrawing money (Euros or Dollars), and transferring funds between accounts.

The `AccountService` object manipulates the domain objects `Account`, `Customer` and `AccountEntry` through the methods mentioned above. An `Account` object and a `Customer` object are created when `CreateAccount()` is called, and an `AccountEntry` is created for every deposit or withdrawal. All changes are then saved to the database through the `AccountDAO`.

Since the `Accounts` only work internally with dollar amounts, all euro deposits and withdrawals are first converted to dollars using a `CurrencyConverter` object.

All `AccountService` methods are logged through the `Logger` object, and whenever an amount greater than 10,000 dollars is deposited or transferred into an account, an additional JMS message is sent to the taxation services department.

Running **App.java** in the **cs544.bank** package should output:

```

Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: createAccount with parameters accountNumber= 1263862 , customerName= Frank Brown
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: createAccount with parameters accountNumber= 4253892 , customerName= John Doe
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: deposit with parameters accountNumber= 1263862 , amount= 240.0
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: deposit with parameters accountNumber= 1263862 , amount= 529.0
CurrencyConverter: converting 230.0 dollars to euros
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: withdrawEuros with parameters accountNumber= 1263862 , amount= 230.0
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: deposit with parameters accountNumber= 4253892 , amount= 12450.0
JMSSender: sending JMS message =Deposit of $ 12450.0 to account with accountNumber=
4253892
CurrencyConverter: converting 200.0 dollars to euros
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: depositEuros with parameters accountNumber= 4253892 , amount= 200.0
Jun 12, 2009 11:45:24 PM bank.logging.Logger log
INFO: transferFunds with parameters fromAccountNumber= 4253892 , toAccountNumber=
1263862 , amount= 100.0 , description= payment of invoice 10232
Statement For Account: 4253892
Account Holder: John Doe
-Date-----Description-----Amount-----
  Fri Jun 12 23:45:24 GMT 2009                deposit                12450.00
  Fri Jun 12 23:45:24 GMT 2009                deposit                 314.00
  Fri Jun 12 23:45:24 GMT 2009    payment of invoice 10232        -100.00
-----
                                Current Balance:                12664.00

Statement For Account: 1263862
Account Holder: Frank Brown
-Date-----Description-----Amount-----
  Fri Jun 12 23:45:24 GMT 2009                deposit                 240.00
  Fri Jun 12 23:45:24 GMT 2009                deposit                 529.00
  Fri Jun 12 23:45:24 GMT 2009                withdraw                -361.10
  Fri Jun 12 23:45:24 GMT 2009    payment of invoice 10232         100.00
-----
                                Current Balance:                507.90

```

The Exercise:

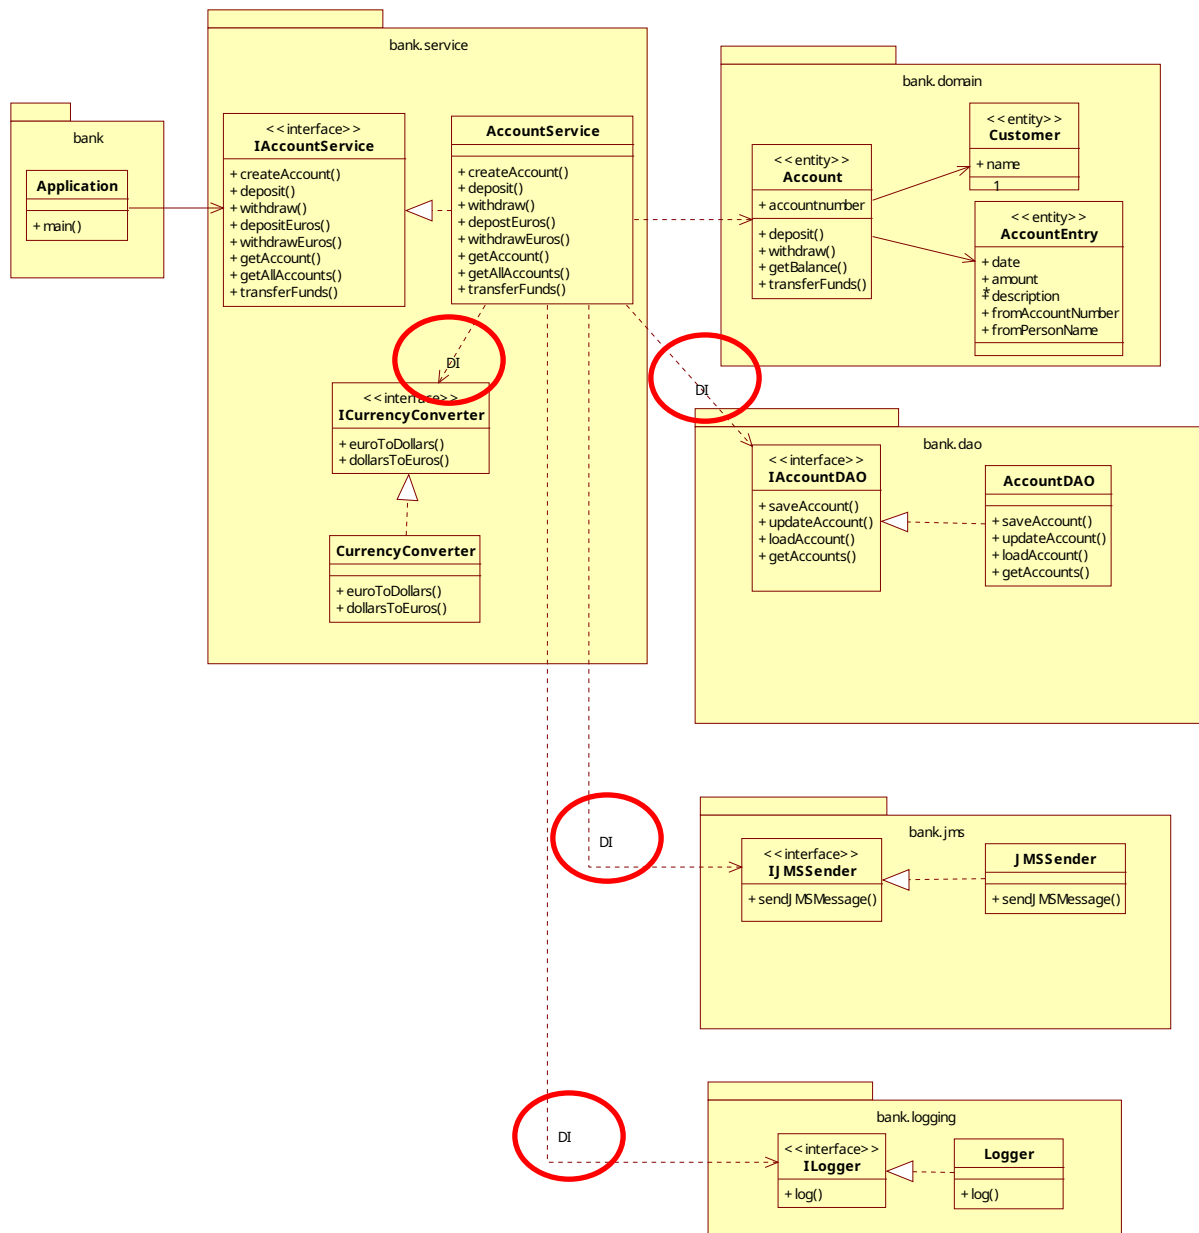

Change the bank application in such a way that the `Logger`, `CurrencyConverter`, `AccountDAO` and `JMSSender` are injected into the `AccountService`, rather than being instantiated with *new*. In other word, `AccountService` should no longer contain these lines:

```

accountDAO = new AccountDAO();
currencyConverter = new CurrencyConverter();
jmsSender = new JMSSender();
logger = new Logger();

```

Also update **App.java** so that it retrieves the `AccountService` from the Spring context.

How to Submit:

Indicate how long it took you to do this exercise and what percentage you finished.

Be sure to delete the target directory from your project before creating the zip file that you upload for grading.

Exercise AOP.2 – Bank Application AOP

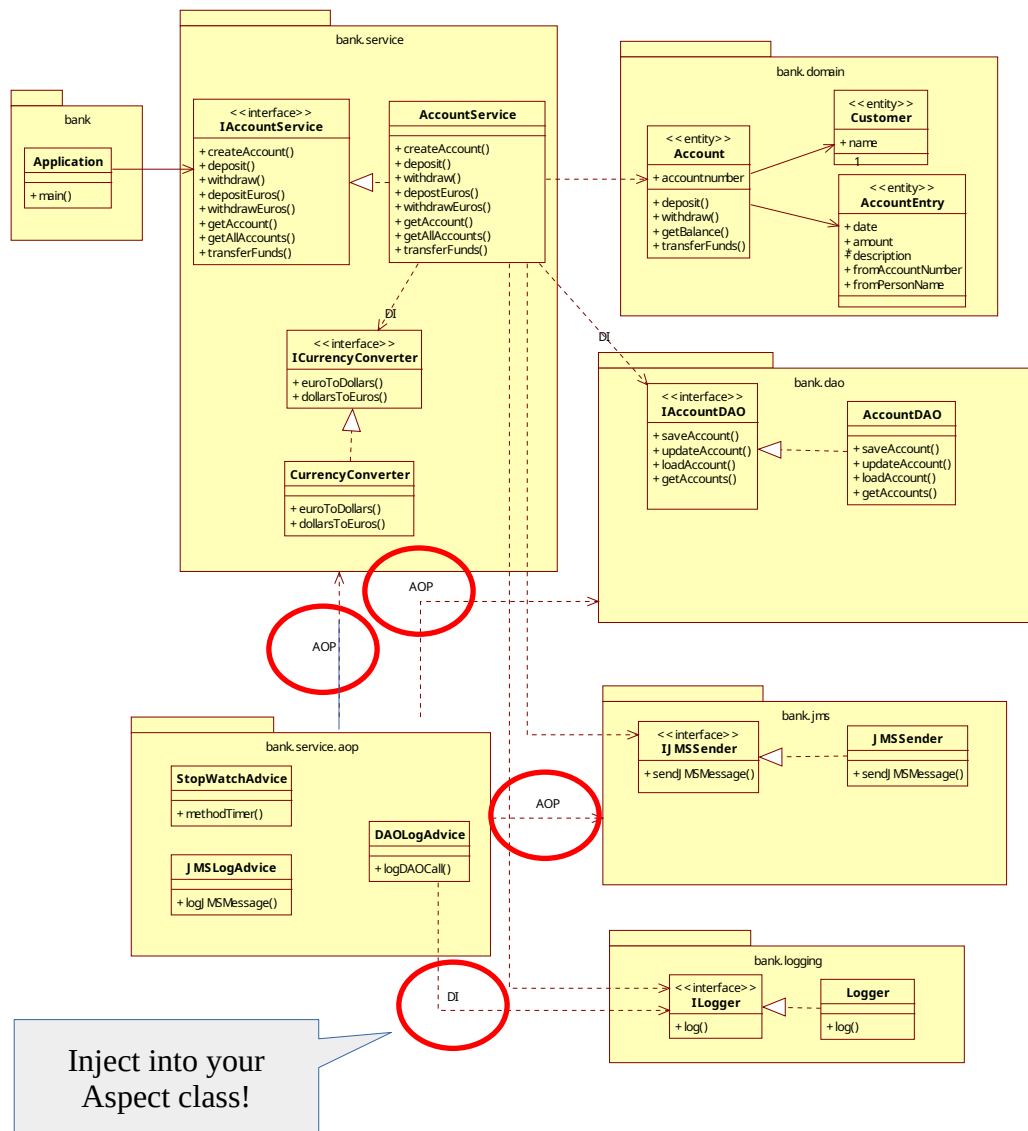

The Setup:

In this exercise, we will be extending the bank application to use AOP. Create a copy of **W1D3-Bank_Application** and call it **W1D3-AOP-2**. Update the pom.xml to have the new name as well, and also add the AOP dependencies (as shown in the first AOP exercise).

The Exercise:

Use AOP to:

- Log every call to any method in the bank.dao package (using the Logger class).
Note: you can simply use System.out.println() – no need to use an actual logger inside the Logger class.
- Use the Spring Stopwatch functionality to measure the duration of all service level methods (any method in the bank.service package) and output the results to the console.
- Log every JMS message that is sent (using the Logger class)
- In AccountService you can remove all the calls to the logger so that it is easier to see whether your advice is running or not.
- Be sure to inject the logger into the advice class as shown below.

How to Submit:

Indicate how long it took you to do this exercise and what percentage you finished.

Be sure to delete the target directory from your project before creating the zip file that you upload for grading.
